where b is a positive real number not equal to 1, and the argument x occurs as an exponent. For real numbers c and d , a function of the form $f(x) = c \cdot b^{dx}$ is also an exponential function, since it can be rewritten as $f(x) = c \cdot (b^d)^x$. As functions of a real variable, exponential functions are uniquely characterized by the fact that the growth rate of such a function (that is, its derivative) is directly ...

For linear growth, the constant additive rate of change over equal increments resulted in adding 2 to the output whenever the input was increased by one. The general form of the exponential function is $f(x) = a \cdot b^x$ where a is any nonzero number, b is a positive real number not equal to 1. If the function grows at a rate proportional to its size.
