Abstract. Geographic information systems combined with methods of spatial analysis provide powerful new tools for understanding the epidemiology of diseases and for improving disease prevention and control. In this study, the spatial distribution of a newly recognized tick-borne disease, human granulocytic ehrlichiosis (HGE), was investigated for nonrandom patterns and clusters in an area known to be endemic for tick-borne diseases.

Mainstreaming integrated spatial analysis into coexistence strategies, however, will require developments in multiple areas, including: overcoming technical challenges of data awareness, processing, and access; establishing new spatial metrics of human social factors, like attitudes; quantifying spatial tradeoffs in human-wildlife interactions, such as in ecosystem (dis)services; protecting highly sensitive, spatial wildlife data (e.g. reproductive locations, high-

To define the cellular composition and architecture of cutaneous squamous cell carcinoma (cSCC), we combined single-cell RNA sequencing with spatial transcriptomics and multiplexed ion beam imaging from a series of human cSCCs and matched normal skin. cSCC exhibited four tumor subpopulations, three recapitulating normal epidermal states, and a tumor-specific keratinocyte (TSK) population ...

Studies that used spatial analysis as a tool are relatively new as more than 90% of the analyzed articles are from the past nine years. Although few health studies conducted in Brazil used this tool, spatial analysis has relevantly contributed to a better understanding of disease epidemiology, leading more researchers to use spatial analysis as a tool in their studies.
