Cataract Surgery And Phacoemulsification For
Definition: Phacoemulsification is the most common cataract surgery technique performed. Cataract surgery is used to restore vision in patients whose vision has become cloudy from cataracts, a clouding of the eye's lens. The lens is located behind the iris. It is responsible for focusing light on the retina, and for producing clear, sharp images.

Phacoemulsification - Cataract Surgery - Verywell Health

Phacoemulsification cataract surgery is a procedure in which an ultrasonic device is used to break up and

Complications is greatly reduced.

Cataract surgery: Procedure and description
Cataract surgery, also called lens replacement surgery, is the removal of the natural lens of the eye that has developed an opacification, which is referred to as a cataract, and its replacement with an intraocular lens. Metabolic changes of the crystalline lens fibers over time lead to the development of the cataract, causing impairment or loss of vision. Some infants are born with congenital cataracts, and certain environmental factors may also lead to cataract formation. Early symptoms may in
