The Engine Speed Sensor (G28) is also used as a reference sensor for the crankshaft position and correlates with the Camshaft Position Sensor Bank 1 (G40) and Camshaft Position Sensor Bank 2 (G163). When an engine will not start due to mechanical (spark/fuel/compression/timing) related issues it is not uncommon to set a false G28 fault codes due to extended cranking with a no-start condition.

16705 – Engine Speed Sensor (G28): Implausible Signal TBH I am still not sure which sensor the above (G28) actually relates to. VW told me the it was to the right of the rocker cover and I was happy that my fault went away for a while, but a lot of what I read on other engines says the 'speed sensor' is actually round the back of the engine, as Emma suggests above.

The Engine Speed Sensor (G28) is also used as a reference sensor for the crankshaft position. Check the wiring to/from the sensor and engine control module to rule out harness and module damage due to engine oil or coolant from a failed sensor or tensioner. This is an example from a 2012 Tiguan with Coolant in the ECM which resulted in G28 DTCs in addition to intermittent stalling.

In order to access the engine speed sensor you need to remove the coolant reservoir. This has been shown previously in the Oil Change writeup. You simply remove the one screw shown to the left, and pull up on the reservoir. Lift it out of the way to the right so you can access the speed sensor connector.
