Mental Disorders in Older Adults: Fundamentals of ...

When it comes to mental illness among older adults, the spotlight is on Alzheimer ' s and other psychological disorders related to dementia. With the prevalence of Alzheimer ' s set to triple by 2050, it ' s no wonder that most of the alarm bells are ringing in this area.

Illustrated with abundant clinical material, this book provides essential knowledge and skills for effective mental health practice with older adults. It demonstrates how to evaluate and treat frequently encountered clinical problems in this population, including dementias, mood and anxiety disorders, and paranoid symptoms. Strategies are presented for implementing psychosocial interventions and integrating them with medications. The book also describes insightful approaches for supporting family caregivers and addresses the nuts and bolts of consulting in institutional settings. Combining their expertise as a researcher and an experienced clinician, the authors offer a unique perspective on the challenges facing older adults and how to help them lead more fulfilling and independent lives. Three reproducible forms can also be downloaded and printed in a convenient 8 1/2" x 11" size.

The Handbook of Mental Health and Aging, Third Edition provides a foundational background for practitioners and researchers to understand mental health care in older adults as presented by leading experts in the field. Wherever possible, chapters integrate research into clinical practice. The book opens with conceptual factors, such as the epidemiology of mental health disorders in aging and cultural factors that impact mental health. The book transitions into neurobiological-based topics such as biomarkers, age-related structural changes in the brain, and current models of accelerated aging in mental health. Clinical topics include dementia, neuropsychology, psychotherapy, psychopharmacology, mood disorders, anxiety, schizophrenia, sleep disorders, and substance abuse. The book closes with current and future trends in geriatric mental health, including the brain functional connectome, repetitive transcranial magnetic stimulation (rTMS), technology-based interventions, and treatment innovations. Identifies factors influencing mental health in older adults Includes biological, sociological, and psychological factors Reviews epidemiology of different mental health disorders Supplies separate chapters on grief, schizophrenia, mood, anxiety, and sleep disorders Discusses biomarkers and genetics of mental health and aging Provides assessment and treatment approaches

Fully updated and revised, this new edition of a highly successful text provides students, clinicians, and academics with a thorough introduction to aging and mental health. The third edition of Aging and Mental Health is filled with new updates and features, including the impact of the DSM-5 on diagnosis and treatment of older adults. Like its predecessors, it uses case examples to introduce readers to the field of aging and mental health. It also provides both a synopsis of basic gerontology needed for clinical work with older adults and an analysis of several facets of aging well. Introductory chapters are followed by a series of chapters that describe the major theoretical models used to understand mental health and mental disorders among older adults. Following entries are devoted to the major forms of mental disorders in later life, with a focus on diagnosis, assessment, and treatment issues. Finally, the book focuses on the settings and contexts of professional mental health practice and on emerging policy issues that affect research and practice. This combination of theory and practice helps readers conceptualize mental health problems in later life and negotiate the complex decisions involved with the assessment and treatment of those problems. Features new material on important topics including positive mental health, hoarding disorder, chronic pain, housing, caregiving, and ethical and legal concerns Substantially revised and updated throughout, including reference to the DSM-5 Offers chapter-end recommendations of websites for further information Includes discussion questions and critical thinking questions at the end of each chapter Aging and Mental Health, Third Edition is an ideal text for advanced undergraduate and graduate students in psychology, for service providers in psychology, psychiatry, social work, and counseling, and for clinicians who are experienced mental health service providers but who have not had much experience working specifically with older adults and their families.

At least 5.6 million to 8 million—nearly one in five—older adults in America have one or more mental health and substance use conditions, which present unique challenges for their care. With the number of adults age 65 and older projected to soar from 40.3 million in 2010 to 72.1 million by 2030, the aging of America holds profound consequences for the nation. For decades, policymakers have been warned that the nation's health care workforce is ill-equipped to care for a rapidly growing and increasingly diverse population. In the specific disciplines of mental health and substance use, there have been similar warnings about serious workforce shortages, insufficient workforce diversity, and lack of basic competence and core knowledge in key areas. Following its 2008 report highlighting the urgency of expanding and strengthening the geriatric health care workforce, the IOM was asked by the Department of Health and Human Services to undertake a complementary study on the geriatric mental health and substance use workforce. The Mental Health and Substance Use Workforce for Older Adults: In Whose Hands? assesses the needs of this population and the workforce that serves it. The breadth and magnitude of inadequate workforce training and personnel shortages have grown to such proportions, says the committee, that no single approach, nor a few isolated changes in disparate federal agencies or programs, can adequately address the issue. Overcoming these challenges will require focused and coordinated action by all.

Community Mental Health for Older People is the perfect resource for mental health workers as it discusses the ageing population, within the context of community mental health. It provides a comprehensive overview of the important issues and clinical practices that influence mental health care for older people. Written from a multidisciplinary perspective it is suitable for all health workers in community mental health teams (Aboriginal and Torres Strait Islander health workers, clinical psychologists, consumer representatives, medical practitioners, occupational therapists, registered nurses, social workers, etc) as it incorporates the use of case studies to aid in the application of evidence-based practice. Multidisciplinary approach serves to illustrate the breadth and context of mental issues for older people Chapters are topical and relevant, discussing issues such as service provision, cultural and rural issues, major disorders and interventions, as well as ethical and legal issues. Vignettes are included throughout the clinical chapters and serve to illustrate real cases derived from practice Evidence-based practice is a key element to this pivotal new text as it highlights the best method of practise, in a clear and accessible manner. Highly readable style without the bulkiness of excessive references This text will cover issues relevant to the mental health of older people within a community context in Australia and New Zealand. Issues will include population health and the clinical management of the major concerns experienced with the diverse clinical presentations by older people. The mental health care of older people is now considered a specialist area with older person's mental health services being key components of the mental health service framework. The publication is primarily aimed at health workers in community mental health teams (registered nurses, clinical psychologists, medical practitioners, social workers, occupational therapists, Aboriginal and Torres Strait Islander health workers etc), but would incorporate those trainee health professionals involved in relevant undergraduate and postgraduate studies.

This volume presents the foundational knowledge and skills that mental health practitioners need to meet the growing needs of our aging population. Thorough coverage is provided of normal aging processes and their effects on intellectual functioning, memory, personality, and other areas. Common psychological problems are discussed, and a comprehensive framework for evaluation and treatment is delineated. Outlining helpful concepts and approaches to guide psychotherapeutic work with this population, the book describes ways to coordinate psychological interventions with psychiatric treatment and supportive services. A special section is devoted to working with families on alleviating caregiver stress, simplifying the senior's living environment, and weighing difficult decisions about the level of assistance a loved one may need. Other topics covered include working as a consultant in nursing homes and dealing with ethical questions around confidentiality and end-of-life issues. An essential resource for clinicians, this book also serves as a text for courses in psychology and aging, gerontology, and geriatric psychology.

The older adult population is booming in the United State and across the globe. With this boom comes an increase in the number of older adults who experience psychological disorders. Current estimates suggest that about 20% of older persons are diagnosable with a mental disorder: Personality disorders are among the most poorly understood, challenging, and frustrating of these disorders among older adults. This book is designed to provide scholarly and scientifically-based guidance about the diagnosis, assessment, and treatment of personality disorders to health professionals, mental health professionals, and senior service professionals who encounter personality-disordered or "difficult" older adults.

This book is a practical resource that will support the delivery of holistic mental health interventions in the primary and community care setting for older people. Primary care delivery is discussed in relation to both functional mental health problems, such as anxiety, depression, and psychotic and personality disorders, and acquired organic mental disorders of old age, such as dementia, cognitive impairments, and delirium. Careful consideration is paid to the complex relationship between mental and somatic health problems, as well as the impacts of multimorbidity and polypharmacy. Further topics include, for example, epidemiology, wider determinants of health, different care models, history taking, neurocognitive and capacity assessment, and pharmacological, psychological, and physical interventions. The wider goals of the book are to support the development of community resilience and self-care in older people; to promote universal access and equity for older people in order to enable them to achieve or recover the highest attainable standard of health, regardless of age, gender, or social position; and to promote pathways to care for older people with mental health problems respecting their autonomy, independence, human rights, and the importance of the life-course approach. This book will be an invaluable resource for all professionals who work with older adults with mental health problems and those training in these fields including physicians, psychiatrists, family doctors, geriatricians, general practitioners, nurses, psychologists, neurologists, occupational therapists, social workers, support workers and community health and social care workers.

As the population ages, increasing numbers of older people require the attention and services of mental health professionals. Despite their prevalence, however, mental health problems in this population often go undiagnosed and therefore untreated. This textbook offers medical students and professionals the information they need to care for older people with mental disorders. Drs. Donna Cohen and Carl Eisdorfer, two internationally recognized experts in geriatric mental health, provide a comprehensive framework within which students and practitioners alike can address the salient issues of the field. These include the biopsychosocial aging processes, specific pathologies prevalent in later life, social issues common to the elderly, the delivery of care in various settings, and the economic policies affecting services for older people. The authors' goal is not only to enhance clinical practice but also to urge physicians to develop and coordinate a more holistic care strategy that acknowledges the complex challenges of older patients. To this end, Cohen and Eisdorfer discuss essential principles of optimal care, the latest research findings, evidence- and consensus-based practice standards, resources to help professionals keep abreast of the changing mental health landscape, and ethical dilemmas of clinical practice and research. The signal strength of this book lies in its integrated approach, an approach that emphasizes the philosophy and principles of caring for older people along with clinical practices and issues. From this broader perspective, the authors describe the many factors that influence the lives, health, and well-being of older patients and their caregivers, making this an ideal text for psychiatrists, psychologists, nurses, and social workers.

Thorough coverage of the nature and problems of old age--healthy, successful old age; common emotional problems; psychiatric disorders; organic mental disorders; special concerns in connection with race and ethnicity, gender issues, crime, alcoholism, deafness, blindness, and sexuality--and evaluation, treatment, and prevention.
