Weathering is the process that changes solid rock into sediments. Sediments were described in the Rocks chapter. With weathering, rock is disintegrated. It breaks into pieces. Once these sediments are separated from the rocks, erosion is the process that moves the sediments. Erosion is the next chapter's topic.

~~Weathering and Erosion Song - YouTube~~

Erosion, on the other hand, causes rocks -- or particles of rock -- to be carried away from their original locations and deposited elsewhere. Weathering often leads to erosion, breaking down the rock into small pieces that are easier for wind and water to carry away.

Bookmark File PDF Weathering And Erosion Mr Stones Place Home

Wind abrasion is an example of a process that includes both weathering and erosion. Wind picks up small pieces of rock and blows them against larger stones, causing small particles of the larger formations to break off.

Rocks gradually wear away, a process called weathering. Biological, chemical and physical weathering are three types of weathering. Weathering and erosion are part of the rock cycle.

braking when he reaches the bottom. After Mr. Stone falls, he ends up in a river.

~~The Process of Weathering, Erosion, and Deposition~~

Most weathering, however, is a slow process that happens over thousands or millions of years. The speed at which weathering and erosion take place depends on the type of material that is being worn away. Some hard rock, like granite, wears away slowly, while softer rock like limestone, wears away much more quickly.

~~Erosion, weathering and mass movement - River processes ...~~

Huge boulders and rocks break down over a period of time to form particles of soil or sand. There are various types of weathering, like physical or mechanical weathering as well as chemical weathering. When rocks and minerals decay away naturally on the earth's surface, weathering is caused. Weathering Caused By Animals And Plants

~~And Erosion?~~

Processes of weathering are generally associated with particular types of gravestone or particular environments. Marble, for example, is assumed to decay mainly through dissolution by acidic rainfall (natural rainfall is slightly acidic, being a weak carbonic acid with a pH of 5.6).
